

App Trader potential investments report

Findings by the Super SQL Team

This report contains findings based on a recent sql dive into tables provided by both Google Play and the AppStore, this independent project was done at the request of App Trader to help investigate which apps would be most profitable to purchase as an investment for their company, here is our findings.

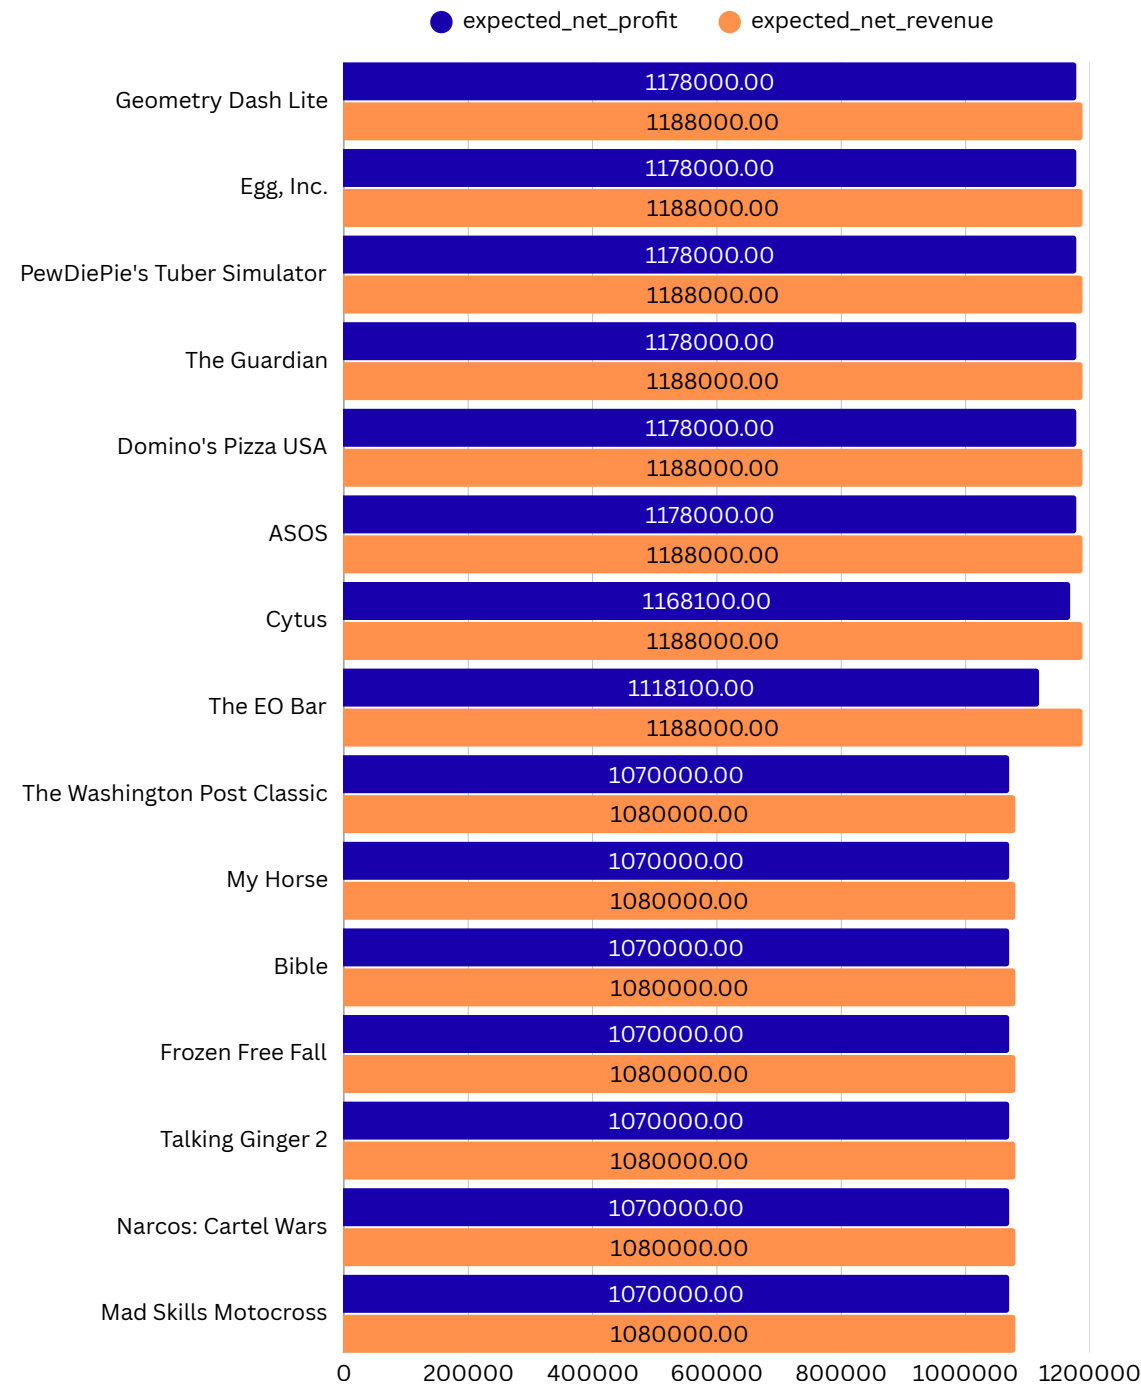

By running multiple queries, we were able to determine a suitable top 10 list, in fact we expanded it to a top 15 to show that there are so many apps with the same projected net revenues, out top 10 is as follows.

1. Geometry Dash Lite
2. Egg Inc.
3. PewDiePie's Tuber Simulator
4. The Guardian
5. Domino's Pizza USA
6. ASOS
7. Cytus
8. The EO Bar
9. The Washington Post Classic
10. My Horse

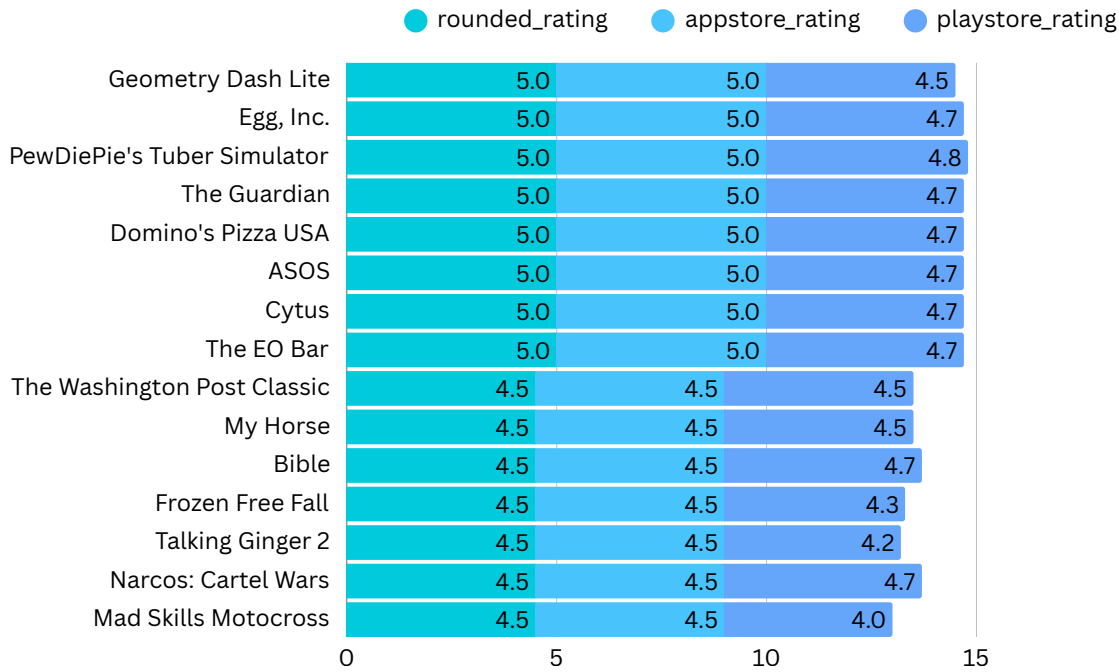

With the top 6 all expected to gain a net Profit of \$1,178,000 over the course of their projected lifecycle.

We calculated these results by using the following metrics.

- Estimating an average of \$1,000 spent per month in marketing expenses.
- Calculating an average of \$5,000 earned per month from each store it is on with this whole list being on both stores.

Ratings per app

- Calculating the expected lifecycle of each app being 1 year for every 0.5 the rounded average rating each app has between both stores (4.5 = 9 years)
- And finally, by subtracting the estimated value or purchase price of each app from the expected net profit column to create the estimated net revenue column, which we used to order our findings today.

We also recommend looking at apps that re free on both app stores, while they may all bring in about the same amount of money, by staying with an app that is free to download (and in turn, has a lesser purchase price for you) you will maximize your ROI and in turn, you may be able to invest into more apps at once.

We here at the Super SQL Team firmly believe that the insights provided here today will show you the best insights on your future investments, thank you for the opportunity to serve you!

Expected lifespan by years
